

Company profile

# A great Italian excellence.

Esti plays a leading role in the production of wear-resistant steel spare parts. The company is distinguished by intensive R&D activity that results in the development of new product solutions, a careful choice of raw materials and production processes that have made the  brand a synonym of guaranteed quality and reliability.

## Profiles range

# Rolled profiles. High quality.

Esti produces blades for loader and excavator buckets, for dozers, for graders and for snowplows. The type of steel used, the careful heat treatment and the low tolerances for mechanical work do allow to obtain high quality products with high wear resistance.

The rolled profiles produced with new **ESTRONG®** steel represent the maximum expression of wear-resistant steel.

The merger of Esti and Acciaierie Venete has created a new organization, unique of its kind, which allows the creation of a **complete production chain**. Such organization allows even the most demanding customers to find a highly reliable partner in Esti, because it has control of the entire production process.

# New lines. New shapes.

Esti's range of products includes fork teeth, shank teeth, tips and parts with different shapes and dimensions suitable for all types of earthmoving machinery.

A strong point is **SILVER**, innovative and patented range, with a shape designed to facilitate penetrating the soil while maintaining high wear resistance.

The brand  on every product represents the commitment Esti has made to guarantee its customers high quality products.
