SOLENOID VALVE TERMINOLOGY

I. DIRECT ACTING VALVE

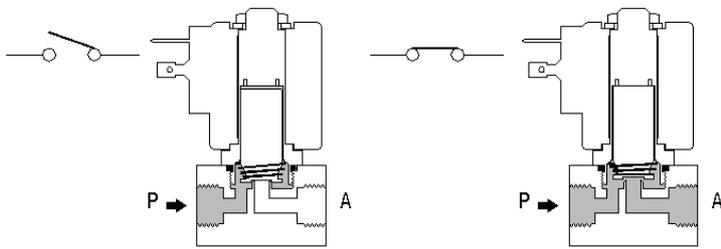

1. Coil
2. Solenoid base
3. Solenoid core
4. Core spring
5. Sealing disc
6. Valve body

II. DIAPHRAGM (OR PISTON) VALVE

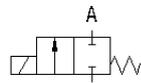

1. Coil
2. Solenoid base
3. Solenoid core
4. Core spring
5. Sealing disc
6. Valve body
7. Diaphragm (or piston)
8. Diaphragm (or piston) spring
9. Pilot orifice
10. Valve bonnet

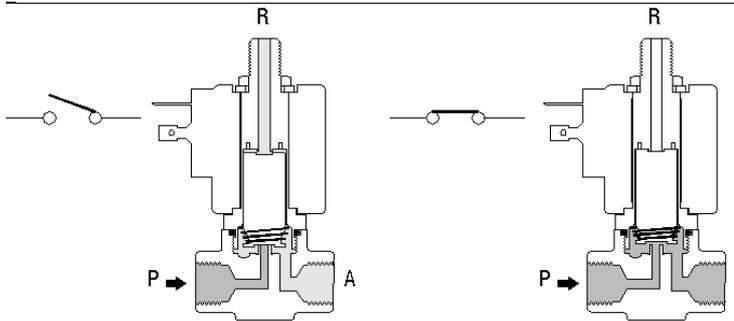

2/2 CLOSED WHEN DE-ENERGISED (NC) DIRECT ACTING

When the coil is energised the valve opens. The valve does not require minimum operating pressure differential. Maximum operating pressure depends on the orifice diameter and coil power. Due to the coil power limitations high flow rates cannot be achieved.

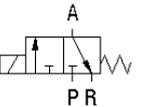

P

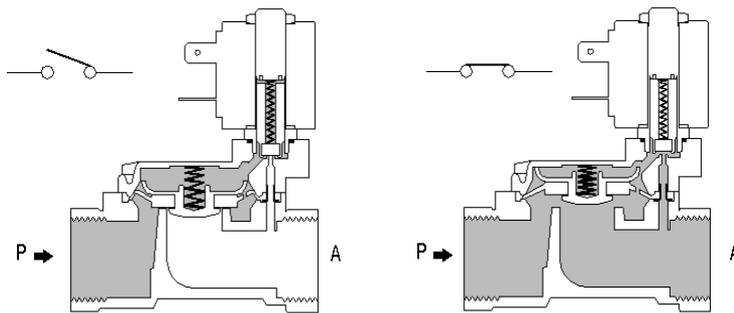

3/2 CLOSED WHEN DE-ENERGISED (NC) DIRECT ACTING

Valve function similar to 2/2 NC, only with 3 ports that allow 2 ways simultaneously: one open and the other closed. 3/2 valves are often used as cylinder activators.

The same valve also allows NO function when properly connected.

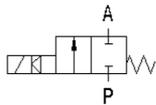

P R

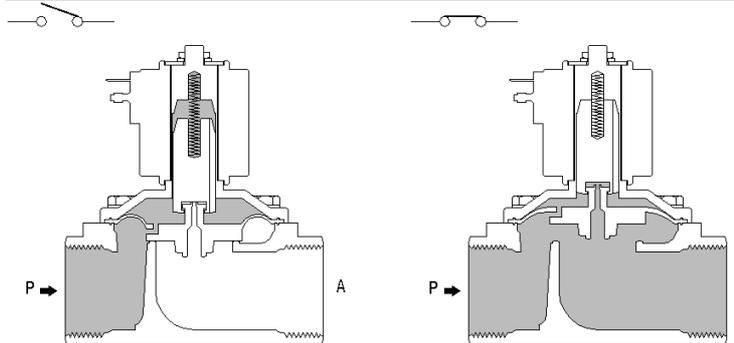

2/2 CLOSED WHEN DE-ENERGISED (NC) PILOT-OPERATED

Valve orifice is closed by a diaphragm or a piston. A bypass connects the chamber above the diaphragm/piston and valve outlet. Bypass is closed by a solenoid core and opens when coil is energized. When this occurs, the pressure above the diaphragm/piston drops and the flow through the valve is established.

This principle of operation requires pressure difference between the valve inlet and outlet and is therefore not applicable at pressures near 0 bar.

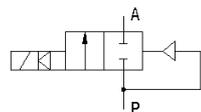

P

2/2 CLOSED WHEN DE-ENERGISED (NC) COMBINED OPERATION

Principle of operation combines direct acting and pilot. Valve diaphragm or piston is attached to the solenoid core and no pressure difference is required. This principle allows high flow rate at pressure near 0 bar.

P

ENGINEERING MATERIALS

The choice of materials used depends on the type of fluid to be controlled.

Bodies

are made of machined brass, bronze, thermoplasts, stainless steel or nickelized brass or bronze.

Seals - diaphragms

are chosen according to mechanical, thermal and chemical requirements.

NBR is the standard material for use with neutral chemically fluids at temperatures up to 90°C.

At higher temperatures, EPDM, FPM and PTFE can be used.

In some cases (high temperature and high cycling rate) stainless steel can also be used.

Characteristics of sealing materials

NBR

- high mechanical durability
- resistant to oil and grease
- tight shut-off
- temperature range: -10°C to +90°C
- fluids: water, fuel, mineral oil, air, argon, town gas, methane, propane, butane

EPDM

- resistant to acids and lyes of medium concentration
- **non-resistant to oil**
- tight shut-off
- temperature range: -40°C to +130°C
- fluids: hot water, wet steam, ozone, ethylene and methylene alcohol, acids and lyes

FPM

- excellent chemical resistance
- mechanical durability lower than NBR or EPDM
- tight shut-off
- temperature range: -15°C to +200°C
- fluids: hot and oiled air, acids, lyes and other fluids that do not allow use of NBR or EPDM

PTFE

- resistant to almost all chemicals
- non-resilient, shut-off with slight leakage
- temperature range: -200°C to +250°C
- fluids: various chemicals, refrigerants, ammonia, dry steam

ELECTRICAL CHARACTERISTICS

All coils are designed for continuous duty (ED100%). Exceptions are marked on individual coil or valve types.

Wire insulation is class F (155°C) or H (180 or 200°C).

Voltage tolerance is $\pm 10\%$ at AC and $\pm 5\%$ at DC.

Power consumption is stated in watts (W) and equals:

- the product of measured DC voltage and current
- the product of measured AC voltage and current multiplied by 0.6

Thermal conditions

When the coil has been energized for a period of time the temperature of the winding rises. Amount of heating is affected by ambient and fluid temperature.

In extreme cases the overheating causes damage to the wire insulation and the coil becomes defective.

Special coils for extreme thermal conditions are also available.

Electrical protection - IP rating

Apart from standard coils, original explosion- and waterproof coils are also available, thus allowing the use of solenoid valves in practically any environment.

Standard coils are encapsulated in special thermoplastic resin which prevents the intrusion of damp and protects the winding from mechanical damage.

Explosionproof coils are encapsulated in epoxy resin.

Basic IP rating for a coil is IP00, whereas IP65 can be achieved with properly fitted plug (to DIN 43650).

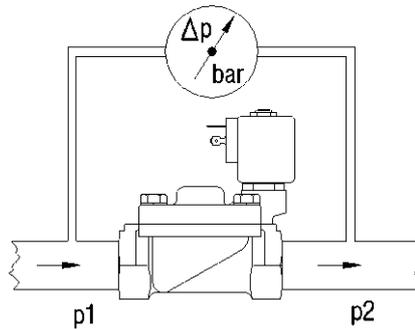

The TM35k type coil with IP67 rating is designed for extremely damp ambients (also water immersion).

FLOW RATE AND Kv VALUE

Flow rate of any given valve depends on valve size, type of fluid and the pressure which forces the fluid through the valve.

Kv value is given for each valve type in the table. With known parameters the flow rate can be calculated according to the following formula:

$$Q = K_v \sqrt{\frac{\Delta p}{\rho}}$$
$$\Delta p = p_1 - p_2$$

- Q flow rate [l/min]
- Kv value given in the table for each valve type
- Δp difference between inlet and outlet pressure [bar]
- p1 pressure measured at valve inlet [bar]
- p2 pressure measured at valve outlet [bar]
- ρ specific mass of fluid [kg/dm³]
(equals 1 for tap water)

Kv value is approximately the same for tap water and other fluids (e.g. oil) of viscosity not exceeding 21mm²/s. At higher viscosity a correction of Kv value is required.

PRESSURE RATING

a) Maximum operating pressure differential is the maximum difference between valve inlet and outlet pressures at which the valve will still reliably operate. Values in tables (with tolerance ±10%) are given at ambient and coil temperature 22°C.

b) Minimum operating pressure differential is the minimum difference between valve inlet and outlet pressures at which the valve will still reliably OPEN. If required pressure difference is not achieved the valve will not open when activated.

c) Maximum static pressure is the highest fluid pressure endured by valve body and internal parts without damage.

INSTALLATION AND RECOMMENDATIONS

Valves can be installed horizontally or vertically. Upright coil position is recommended to avoid accumulation of impurities in pilot which may result in faulty operation.

Before installation it is highly recommended to clean the pipeline to minimize the amount of impurities in fluid.

It is also recommended to install a strainer (40 micron mesh) in front of the valve.

AC coils should not be connected to the electrical circuit unless fitted properly on the stem as this will result in coil burning.

In very damp ambients the use of special coil sealing sets or TM35k type coil is necessary (available from your supplier).

*Pressure is lower when DC coil is used!

ORDERING:

Please state order code and voltage (e.g.: 316401 24VAC) or consult our staff.
For easier valve choice use QUESTIONNAIRE on page 36.

OPTIONS:

- EEx me II explosionproof coils
- NPT ports

Other versions on request.

Specifications are subject to change without notice.

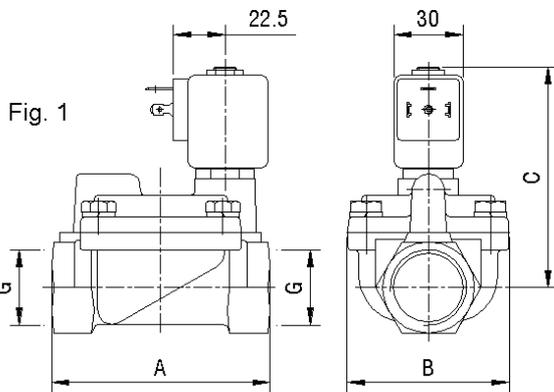

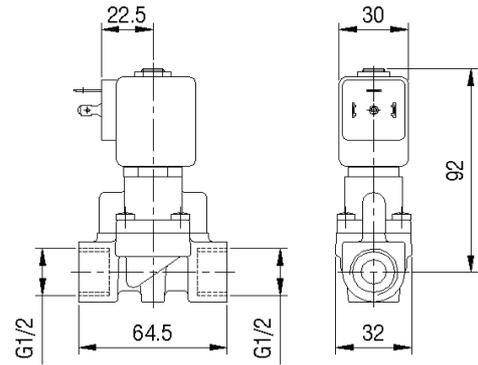

TECHNICAL DATA:

Valve body: Ms
 Internal parts: stainless steel
 Fluid temperature: -10°C to +100°C (PTFE)
 -10°C to +90°C (PA)
 Ambient temperature: max +55°C
 Viscosity: max 21 mm²/s
 Response time: opening 0.1 to 1 s / closing 0.5 to 5 s
 Voltages: 230, 115, 48, 24 V 50/60 Hz
 24, 12 V DC
 Power consumption: see chapter »Coils«
 Duty cycle: continuous (ED100%)
 Cycling rate: 10 to 100 cpm
 Electrical protection: IP65 (with plug to DIN 43650)

ORDERING:

Please state order code, seal and voltage (e.g.: 320717 FPM 24VAC)
or consult our staff.

For easier valve choice use QUESTIONNAIRE on page 36.

OPTIONS:

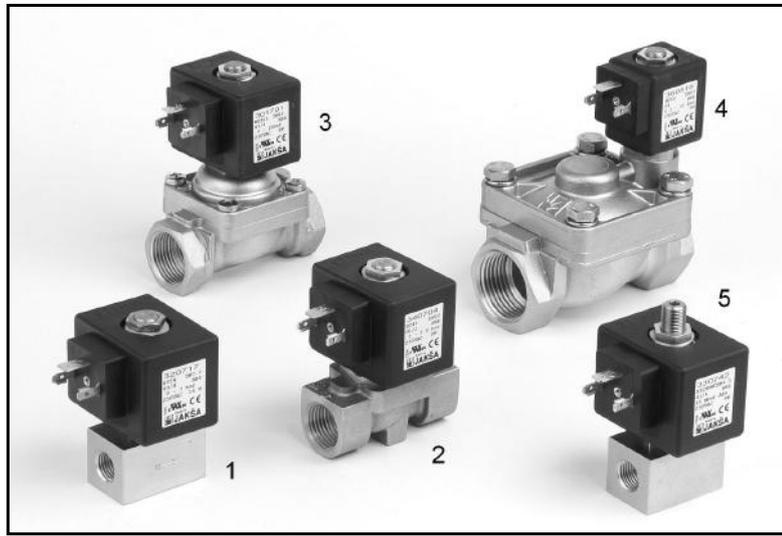

- EEx me II explosionproof coils
- NPT ports

Other versions on request.

Specifications are subject to change without notice.

TECHNICAL DATA:

Internal parts:	stainless steel
Seals:	NBR, FPM
Fluid temperature:	-10°C to +90°C (NBR)
Ambient temperature:	max +60°C
Viscosity:	max 21 mm ² /s
Response time:	5 to 120 ms
Voltage:	230, 115, 48, 24 V 50/60 Hz 24, 12 V DC
Power consumption:	see chapter »Coils«
Duty cycle:	continuous (ED100%)
Cycling rate:	250 to 800 cpm
Electrical protection:	IP65 (with plug to DIN 43650)

1. Pilot operated diaphragm and piston valves

<i>Problem</i>	<i>Probable cause</i>	<i>How to correct</i>
Valve does not open when coil is energised.	No voltage supply. Voltage may be too low or incorrect.	Check voltage; voltage must be within declared limits (AC $\pm 10\%$; DC $\pm 5\%$).
	Pilot orifice is blocked.	Deassemble valve and clean pilot orifice.
	Diaphragm or piston ring is ruptured.	Replace damaged part.
	Dirt or calcium deposits within solenoid base is blocking solenoid core.	Deassemble valve and clean thoroughly; install strainer on the inlet side of valve.
	Inlet pressure is too high.	Reduce pressure if possible; consult our staff over valve's suitability.
	Pressure difference is insufficient.	Valve may be oversized for your application; increase inlet pressure if valve permits or replace valve with smaller one,
	Solenoid base is damaged.	Replace damaged part.
Valve does not close when coil is de-energised.	Coil is burned.	Replace coil. Refer to section 3 for probable causes of coil burning.
	Coil is still energised.	Check electrical circuit.
	Flow direction is incorrect.	Check valve orientation; arrow mark on valve body indicates flow direction.
	Pilot orifice is blocked.	Deassemble valve and clean pilot orifice.
	Dirt or calcium deposits within solenoid base is blocking solenoid core.	Deassemble valve and clean thoroughly; install strainer on the inlet side of valve.
Valve does not shut tightly or it leaks.	Solenoid base is damaged.	Replace damaged part.
	Damaged sealing disc / diaphragm / valve seat / solenoid core spring.	Replace damaged part; never stretch or shorten core spring!
	Pressure difference is insufficient.	Valve may be oversized for your application; increase inlet pressure if valve permits or replace valve with smaller one,

2. Direct acting valves

<i>Problem</i>	<i>Probable cause</i>	<i>How to correct</i>
Valve does not open when coil is energised.	No voltage supply. Voltage may be too low or incorrect.	Check voltage; voltage must be within declared limits (AC $\pm 10\%$; DC $\pm 5\%$).
	Inlet pressure is too high.	Reduce pressure if possible; consult our staff over valve's suitability.
	Dirt or calcium deposits within solenoid base is blocking solenoid core; solenoid base may be damaged.	Deassemble valve and clean thoroughly; replace damaged parts; install strainer on the inlet side of valve.
	Coil is burned.	Replace coil. Refer to section 3 for probable causes of coil burning.
Valve does not close when coil is de-energised.	Coil is still energised.	Check electrical circuit.
	Flow direction is incorrect.	Check valve orientation; arrow mark on valve body indicates flow direction.
	Dirt or calcium deposits within solenoid base is blocking solenoid core.	Deassemble valve and clean thoroughly; install strainer on the inlet side of valve.
	Solenoid base is damaged.	Replace damaged part.
Valve does not shut tightly or it leaks.	Damaged sealing disc / valve seat / solenoid core spring.	Replace damaged part; never stretch or shorten core spring!

3. Coils

<i>Problem</i>	<i>Probable cause</i>	<i>Prevention</i>
Coil is burned.	Dirt or calcium deposits within solenoid base blocking solenoid core.	Deassemble valve and clean thoroughly; install strainer on the inlet side of valve.
	There is moisture inside coil.	Seal and tighten cable gland; make sure that plug seals are in place; use sealing set or TM24 coil in humid environment (see page 33).
	Solenoid core does not move due to excessive fluid pressure.	Reduce pressure or install suitable valve; consult our staff over valve's suitability.
	Solenoid core is blocked due to damaged solenoid base or core spring.	Deassemble valve and clean thoroughly; replace damaged parts.
	Valve is missing parts or is not properly assembled.	Check valve assembly; replace missing parts if necessary.
	Supply voltage is too high or incorrect.	Check voltage; voltage must be within declared limits (AC $\pm 10\%$; DC $\pm 5\%$).
	Fluid and/or ambient temperature is too high.	Consult our staff over suitability of chosen valve/coil.

BASIC UNIT CONVERSIONS

Pressure
 1 bar = 14.50326 PSI
 1 bar = 10 N/cm²
 1 bar = 0.1 MPa
 1 PSI = 0.06895 bar
 1 kg/cm² = 0.981 bar

Temperature
 °F = (°C x 9/5) + 32
 °C = (°F - 32) x 5/9
 K = °C + 273

Flow rate
 1 l/min = 16.667 m³/h
 1 l/min = 1.412579 x 10⁻³ cu ft/min (CFM)
 1 m³/h = 0.06 l/min

Mass
 1 kg = 35.27399 oz.
 1 kg = 2.2 lb
 1 lb = 0.455 kg

QUESTIONNAIRE

1. Application

Type of fluid

Possible additives or impurities in fluid

Maximum fluid temperature

Minimum fluid temperature

Viscosity

Operating pressure [bar]

Maximum

Minimum

Normal

Desired flow rate

[l/min; m³/h; kg/h]

Ambient temperature

Minimum

Maximum

2. Valve design

Ports

Orifice size

Valve body material

Seal material

Function

2/2 NC

2/2 NO

3/2 NC

3/2 NO

NC = closed when
de-energised

Other

NO = open when
de-energised

Voltage

Coil energised:

Continuously

Intermittently

Time ON

Time OFF

Ambient description (dry, humid, dusty, outdoor,...)

Quantity required:
