air-assisted spraying system

Air-Spray

the present and the future in crop protection

lower environmental impact

great canopy coverage

plant protection products usage reduction

well-timed and effective spraying

extended spraying range

quick costs recover

Toselli

the choice of professionals

Toselli air-assisted AirSpray system has been developed in many years of successful experiences in lots of different spraying conditions. The very best feature is the ability to **provide increased performances in any working conditions**; thanks to various possible adjustments and settings, users are able to **get the best performances in spraying high-canopy crops, post-emergency and nude soil as well.**

The adjustable sleeves in combination with right spraying tip choice, provide the **best canopy penetration and coverage**, reducing in the meanwhile the "out of target" PPP dispersions. **Right setting of air intensity/angle combined with air-induction spraying tips use is a great anti-drift weapon**, allowing a very important "in-time spraying" option.

With AirSpray also **half-boom spraying operations are possible**; many boom settings and foldings are allowed **without any unwanted air shut-off.**

All AirSpray air-assisted systems are equipped with tractor-independent hydraulics and proportional valves for remote air angle and intensity adjustments; all AirSpray commands are located in the main sprayer dashboard, inside tractor cabin.

AirSpray is available exclusively on Toselli sprayers in 2 versions:

AirSpray 620 for booms 12 mts. to 21 mts. (max. power 15 HP)

AirSpray 820 for booms 18 mts. to 28 mts. (max. power 35 HP)
